

Vape Cartridge Dosing Guide

Vape cartridges are a delivery device for vaporised cannabinoids.

General Clinical Use Principles

1. Start low, go slow:

First-time patients are advised to begin with 1 small inhalation (often 1-2 second draw).

2. Wait and monitor:

Effects can occur within minutes, so patients are advised to wait 10-15 minutes before considering another inhalation.

3. Gradual titration:

If well tolerated, patients may increase to 2-3 small inhalations per session, spaced apart, as guided by their health care professional.

1g Vape Cartridge Inhales on average:

Grams	Battery	Draws
1g	2 - 4.2V	100-200
1g	~2v	200-300

Recommended Use:

Draw Length	1 - 2 Seconds	Inhales: 1
-------------	---------------	------------

Alfie Vape Cartridge Dosing Guide

Based on vaporisers with a standard 2-4.2V battery strength + average inhalation

Balanced GT Haze	340mg THC + 340mg CBD + 210mg CBG	150 inhales = 2.27mg THC/CBD, 1.4mg CBG per draw	200 inhales = 1.7mg THC/CBD, 1mg CBG per draw
GT Haze	800mg THC Cart	150 inhales = 5.33mg THC per draw	200 inhales = 4mg per draw
Crescendo Kush	800mg THC Cart	150 inhales = 5.33mg THC per draw	200 inhales = 4mg THC per draw
EVO Live Resin	720mg THC Cart	150 inhales = 4.8mg THC per draw	200 inhales = 3.6mg THC per draw

Clinical Note: It can be challenging to calculate an exact mg per draw with vape cartridges, as outcomes depend on: Battery strength (voltage), Draw intensity, Duration of inhalation.
