

DICHONDRA

Dichondra Repens is a warm season ground cover that has a prostrate growth habit.

Appearance:

Dichondra has broad, circular leaves and is used in many situations where grasses may not do well eg. In shaded areas under trees. It has a bright green colour and a cushion feel underfoot. It looks beautiful in landscaped areas where it does not need to be mown.

Uses:

Dichondra is best suited to areas of little traffic as it has very low wearability. Dichondra is ideal for low maintenance areas or erosion control in some places

Seeding & Preparation:

Dichondra needs to be planted on a weed free prepared seedbed. The seedbed surface needs to be lightly raked with an even spread of seed. Weeds need to be eliminated from the beginning as removal is difficult once dichondra becomes established.

Dichondra needs well drained soils with deep waterings to fully prosper; shallow waterings may cause Dichondra to easily wilt if under stress.

Seeding:

For optimum results a seeding rate of 1kg per 100m² should be used.

Mowing:

A maintenance height of 15–40mm depending upon traffic.
