

ELITE
BACTERIAL CLEANER POLISHER

ELITE is a pleasantly perfumed yet powerful green creme cleaner-polisher formulated to thoroughly clean, disinfect and polish a wide variety of surfaces without a deleterious effect and to provide a lustrous, water repellent, protective film to the surface.

The use of **ELITE** is indicated whenever the desire is to render all inanimate surfaces, for which the product is recommended, physically clean and free from most common bacteria whilst simultaneously providing a polishing protective film to retard re-soilage and make subsequent cleaning easier and faster.

BACKGROUND INFORMATION

Abrasive powders, often based on pumice, quartz or feldspar can seriously scratch and damage such surfaces as hand basins and baths etc. Making them increasingly prone to soilage, dull in appearance and permanently damaged.

These abrasive foaming cleansers were originally made for scouring iron pots and pans but have since been widely used for cleaning most inanimate surfaces, often with disastrous results.

It has become increasingly apparent that this type of product must be replaced by a smooth creme liquid formulation that is easy to use, safe on all surfaces, as well as the hands of the user, is bactericidal and will provide a lustrous protective shine to the surface - for these reasons **ELITE** was formulated.

APPLICATIONS

ELITE will safely clean and polish the following surfaces:

Wash basins, baths, shower stalls, porcelain, vitreous enamel surfaces, stainless steel benches and equipment, tile walls, aluminium, copper, brass, chrome plated fixtures, stoves, refrigerators and plastic laminates (formica, laminex).

BACTERICIDAL PROPERTIES

ELITE has been tested by an independent bacteriological laboratory to be effective against the following representative test organisms to pass the T.G.A Test for Hospital Grade Disinfectants, Clean conditions:

Pseudomonas aeruginosa NCTC 6749
Escherichia coli NCTC 8196
Staphylococcus aureus NCTC 4163
Proteus vulgaris NCTC 4635
