TANK MIXING REVOLUTION

Revolution has been shown to be compatible with many soil targeted products. It can help place soil targeted chemicals and fertilizers more uniformly in the soil and can maximize the effectiveness of these materials.

A report of tank mix compatibility and turf-grass safety for many commonly used turfgrass products is available in the Revolution research section at www.aquatrols.com. As always, it is recommended that a jar test be done to confirm the chemical compatibility of the tank mix, and a strip test be done to confirm turfgrass safety of the tank mix under your conditions.

Revolution should not be tank mixed with iprodione or propiconazole or any product that specifies not to mix with wetting agents or non-ionic surfactants.

IRRIGATION UNDER A REVOLUTION PROGRAM

Clearly, growing quality turfgrass requires consistent access to water and nutrients in the root-zone. Irrigation strategies for putting greens that use light, daily irrigation

aim to achieve this without creating surface wetness. Unfortunately various factors from inconsistent irrigation coverage to non-uniform soil wetting can actually cause this strategy to result in some areas of the root-zone becoming excessively dry while other areas can still become too wet. Turf quality and consistency suffer as a result.

Most superintendents who have made Revolution part of their turfgrass management program have found they can reduce irrigation frequency and increase run times. Because Revolution allows excess moisture to drain more quickly and completely through the root-zone, superintendents are able to produce drier, firmer putting surfaces while reducing moisture stress on their turfgrass. This is one of the most unique and beneficial features about Revolution compared to other surfactant chemistries.

IRRIGATION TIPS WHEN USING REVOLUTION

To achieve the best turfgrass quality and play-ability on putting greens under a Revolution program, apply enough water with each irrigation to bring the active root-zone (depth of soil where roots are present) up to field capacity and then let it dry down until the turfgrass just begins to show moisture stress before irrigating again. Actual irrigation frequencies will change throughout the year, depending on factors such as the water holding capacity of the soil, changing depth of turfgrass rooting, and weather conditions which influence ET rates and turfgrass water demand.

The reduced irrigation frequencies and in-creased irrigation run times possible under a Revolution program also helps to even out soil moisture inconsistencies that often develop when short, frequent irrigation runs times or hand watering is used exclusively. Deep irrigations or "flushings" periodically during dry or drought conditions will also help leach salts which

accumulate near the surface and are an additional stress factor during the heat of summer.

It's a good idea to monitor soil moisture levels and uniformity. This can be done quickly and accurately with a hand held TDR probe like the Dynamax TH300. For more information on this useful tool visit: www.dynamax.com and enter the Irrigation Control & Soil Moisture Sensors area.

Revolution User's Guide

Thousands of golf course superintendents now use **Revolution** to achieve exceptionally uniform root-zone moisture levels within ranges that allow for drier, firmer putting surfaces while reducing moisture stress on their turfgrass. These superintendents have also helped us gain

valuable additional experience about how to get the most out of this unique surfactant chemistry. This User's Guide is a compilation of what has been learned so you can experience all of the water management and plant health benefits of a Revolution program.

HOW TO USE REVOLUTION

INITIAL APPLICATION

Revolution must be applied at least one month prior to the anticipated onset of stress conditions in your area.

ONGOING MONTHLY PROGRAM

Revolution must be used as part of an ongoing management program beginning prior to and continuing through stress periods. If this does not match your agronomic philosophy, inclination or budget, **Revolution** may not be the product for your turf management program. Ask your Aquatrols representative about other product and program options.

WATERING IN

Revolution is safe for turfgrass and does not need to be watered in immediately after application. However, since **Revolution's** area of activity includes both the thatch/mat layer and the soil, it must be watered in sufficiently to deliver the Revolution molecules to a depth of at least four inches.

This requires about one third of an inch of water on high sand root-zones or other soils with a sand top-dressing layer of four inches or more. On non-sand soils or "push-up" greens with less than a four inch sand topdressing layer, apply up to one half inch of water. **Revolution** should be watered in thoroughly the evening following application.

APPLICATION RATES AND FREQUENCIES

MONTHLY APPLICATION

Apply **Revolution** at 19L/Hectare (190 mL/100 m²).

BIWEEKLY APPLICATION

Following an initial application of 19L/Hectare, **Revolution** can be applied bi-weekly at 9.5L/Hectare.

Thousands of golf course superintendents now use **Revolution** to achieve exceptionally uniform root-zone moisture levels

Aquatrols Solutions from Prebble Seeds

Selecting the best soil surfactant solution for your course can be confusing, but Prebble Seeds is here to help.

With a full selection of superior quality soil surfactants from Aquatrols, Prebble Seeds can help you make the most of your water and keep your course in top form.

Use the charts at right to choose your preferred program type and applicable basic use area(s) to see which Aquatrols product or combination of products is right for you.

Problem/Requirement Program Characteristics	Revolution
Curative Program - Weekly	
Preventative Program -Monthly	√
Long-term Preventative 90 Days	

Basic Use Areas	Revolution
Greens	√
Tees	√
Fairways & Approaches	√
Sport Fields	√
USGA Greens - Sand	√
Push-Up Sand Modified	√
Native Soil	
Stress Management	√
Anthraco nose Mgmt. Program	√
Uniform Moisture Distribution	√
Sward Uniformity	√
Black Algae	√
Fairy Ring Management Pgrm.	√
Increased Root Mass	√
Improved Sward Color	√
Improved Turf Density	√
Increased Nitrogen Efficiency	√
Reduced Runoff	√
Increase Infiltration	√
Hold More Water	
Manage Excess Water	√
New Greens 1 yr	
Greens 1-2 yrs	
Greens 3 yrs.	√
